

## Part & Unit Handling

**Belt Conveyors** provide a versatile means of handling products of various sizes and shapes. General applications include:

- assembly lines
- sorting
- inspection
- transportation
- process systems

Belt Conveyors can be designed specifically for troughing or v-guided applications. For steep inclining or declining conveyors, a cleated belt can be added to help contain the product in the correct orientation. Omni manufactures specially designed belt conveyors for specific industries such as:

- wood panel processing & finishing
- industrial laundry complexes
- automotive assembly lines
- distribution warehouses
- box, bag & tote handling

**Gravity Conveyors** are one of the most cost effective and versatile product lines available. These conveyors are excellent for both permanent and temporary conveyor lines often found in warehouses, shipping departments and assembly areas. Gravity curves and spur options can add to the versatility of straight conveyors.

There are several styles of Gravity Conveyor, including:

- Roller conveyor (light, medium and heavy duty)
- Skatwheel with multiple wheel pattern configurations
- Ball Transfer Tables which allow 360° of operation
